---

Ronnie,

Analysis of ftir data is showing low levels of acetone and so2 west of the tank farm but nothing near the tank farm. It is likely these are just ambient levels of vocs. Max concentration of acetone was estimated at .5 ppm.

We have been looking closely at the tank farm and appear to be see "something" off-gassing. We are not for certain but we think it may detecting something like ethylene glycol. We may be seeing the fire fighting foam.
